

Project Report: Use of Digital Platforms for Learning and Growth

In my project, I chose platforms like **Kaggle**, **Stack Overflow**, and **GitHub** to support my learning in technology and programming. Each of these platforms serves a unique purpose in a student's academic and professional development.

Kaggle is mainly used for data science and machine learning. It provides datasets, notebooks, and competitions that help in improving practical skills. Stack Overflow is a platform where programmers ask and answer technical questions, making it very useful for solving coding problems and understanding errors. GitHub is used to store, manage, and share code, and it also helps in collaborating with other developers on projects.

Over the next four years, I plan to use Kaggle to practice data analysis and participate in competitions, Stack Overflow to resolve coding doubts and learn from experienced developers, and GitHub to build my portfolio by uploading projects and contributing to open-source work. These platforms will help me grow my technical skills and prepare for future career opportunities.
